Key Insights

Error Rate Normal

Error rate is 0.00% (0/220 logs) — within acceptable bounds.

Top Errors (by Frequency)

#	Error Message	Service	Category	Count	% of Total
No error data	—	—	—	—	—

Recommendations & Fixes

MEDIUM

1. High Warning Volume (6 occurrences)

Why it happened: Warning count is disproportionately high relative to errors, which often signals impending failures or unresolved deprecations.

How to fix:

- 1 Filter warning logs by message pattern to identify the top warning types.
 - .
- 2 Investigate deprecation warnings — APIs or configs that will break in a future version.
 - .
- 3 Look for resource-saturation warnings (disk, memory, CPU) and provision capacity if needed.
 - .
- 4 Set up a warning-rate alert (e.g. > 50 per minute) to catch spikes before they escalate to errors.
 - .

LOW

2. Operational Recommendation

How to fix:

- 1 Inspect recent logservice deploys, dependencies, and retries if its error count keeps rising.
 - .

LOW

3. Operational Recommendation

How to fix:

- 1 Correlate the top error message with infrastructure changes and upstream service failures.
 - .

LOW

4. Operational Recommendation

How to fix:

- 1 Warnings outnumber errors — inspect deprecation and saturation signals early.
 - .
